EMISSTAR EXPANDS OPERATIONS INTO CALIFORNIA

SANTA FE SPRINGS, Calif., May 20 /PRNewswire/ — Building upon expertise and success in other areas of the US, Emisstar LLC is pleased to announce the opening of its newest office in California. Strategically located in the Los Angeles Basin in Santa Fe Springs, the opening of this new office expands Emisstar’s consulting practice into a state that is at the forefront of air quality and energy issues.

“We are excited about the opportunities that the State of California offers to Emisstar,” said Emisstar Principal Michael Block. “California is the world’s seventh largest economic engine while being a major worldwide mobile source energy consumer. The opening and staffing of an office in California underscores our commitment to fully serve this all-important marketplace, providing the type of mobile source emissions and energy services that have distinguished our company in other geographic areas of the US. We look forward to working with the California government and the private sector alike to improve California’s air quality and reduce energy consumption, while maintaining the vitality and strength of the State’s economy.”

Emisstar’s entrance into California comes at a critical time for air quality and energy issues. The California Air Resources Board estimates that particulate matter, especially from sources like diesel engines, may be linked to 2,900 premature deaths and 240,000 asthma attacks every year in California. Emissions of nitrogen oxides (NOx) contribute to smog formation and pose human health risks. Finally, greenhouse gases such as carbon dioxide are projected to have significant global warming effects resulting in climate change.

About Emisstar LLC

Emisstar provides consulting services focusing upon the scientific, technology, policy, business and public health challenges surrounding mobile air emissions. With offices in Texas, New York and New England, and now in California, Emisstar offers clients nationwide access to an extensive scope of services encompassing the energy and emissions arena. These services include assisting clients in understanding and reducing criteria pollutants and greenhouse gas emissions; providing state-of-the-art technical services enabling fleets to most effectively meet the requirements of complex energy and emissions regulations; using laboratory test facilities as well as portable emissions measurement systems (PEMS) and other techniques to determine the effectiveness of energy and emissions remediation strategies; assisting freight carriers and logistics providers with sustainable transportation programs to reduce costs and improve their EPA SmartWay ranking; assisting and securing grant funding for a myriad of energy enhancement and emissions reduction programs; and developing strategic planning and market assessment programs enabling clients to best meet the challenges of an ever-evolving marketplace.
